A **graph** consists of two sets V and E .

- V is the set of vertices (or nodes).
- E is the set of edges, where each edge is a pair of vertices.

1.4. Eigenvalues of a graph

A graph G :

Adjacency matrix:

$$A = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}$$

Eigenvalues are

2, 0, 0.

2.1. Wigner's semicircle law

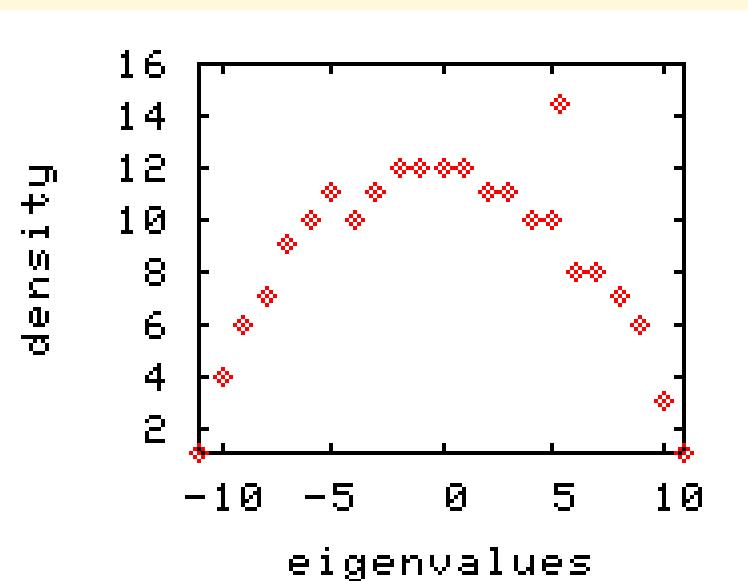

(Wigner, 1958)

- A is a real symmetric $n \times n$ matrix.
- Entries a_{ij} are independent random variables.
- $E(a_{ij}^{2k+1}) = 0$.
- $E(a_{ij}^2) = m^2$.
- $E(a_{ij}^{2k}) < M$.

The distribution of eigenvalues of A converges into a semicircle distribution of radius $2m\sqrt{n}$.

2.2. Evidence for the semicircle law for power law graphs

The eigenvalues of an Erdős-Rényi random graph follow the semicircle law. (Füredi and Komlós, 1981)

2.3. Evidence against the semicircle law for power law graphs

- **Faloutsos et al. (1999, experimental result)** The eigenvalues of the Internet graph do not follow the semicircle law.
- **Farkas et. al. (2001), Goh et. al. (2001)** The spectrum of a power law graph follows a “triangular-like” distribution.
- **Mihail and Papadimitriou (2002)** They showed that the large eigenvalues are determined by the large degrees. Thus, the significant part of the spectrum of a power law graph follows the power law.

$$\mu_i \approx \sqrt{d_i}.$$

Use random graphs to solve the mystery

- Data sets are too large and dynamic for exact analysis.
- Most real-world graphs have a random or statistical nature.

3. Random graphs

A random graph is a set of graphs together with a probability distribution on that set.

[Motivation](#)

4. Eigenvalues

Theorem 1 (Chung, Vu, and Lu, 2003)

Suppose $w_1 \geq w_2 \geq \dots \geq w_n$. Let μ_i be i -th largest eigenvalue of $G(w_1, w_2, \dots, w_n)$. Let $m = w_1$ and $\tilde{d} = \sum_{i=1}^n w_i^2 \rho$. Almost surely we have:

- $(1-o(1)) \max\{\sqrt{m}, \tilde{d}\} \leq \mu_1 \leq 7\sqrt{\log n} \cdot \max\{\sqrt{m}, \tilde{d}\}$.

4. Eigenvalues

Theorem 1 (Chung, Vu, and Lu, 2003)

Suppose $w_1 \geq w_2 \geq \dots \geq w_n$. Let μ_i be i -th largest eigenvalue of $G(w_1, w_2, \dots, w_n)$. Let $m = w_1$ and $\tilde{d} = \sum_{i=1}^n w_i^2 \rho$. Almost surely we have:

- $(1-o(1)) \max\{\sqrt{m}, \tilde{d}\} \leq \mu_1 \leq 7\sqrt{\log n} \cdot \max\{\sqrt{m}, \tilde{d}\}$.
- $\mu_1 = (1 + o(1))\tilde{d}$, if $\tilde{d} > \sqrt{m} \log n$.

4. Eigenvalues

Theorem 1 (Chung, Vu, and Lu, 2003)

Suppose $w_1 \geq w_2 \geq \dots \geq w_n$. Let μ_i be i -th largest eigenvalue of $G(w_1, w_2, \dots, w_n)$. Let $m = w_1$ and $\tilde{d} = \sum_{i=1}^n w_i^2 \rho$. Almost surely we have:

- $(1-o(1)) \max\{\sqrt{m}, \tilde{d}\} \leq \mu_1 \leq 7\sqrt{\log n} \cdot \max\{\sqrt{m}, \tilde{d}\}$.
- $\mu_1 = (1 + o(1))\tilde{d}$, if $\tilde{d} > \sqrt{m} \log n$.
- $\mu_1 = (1 + o(1))\sqrt{m}$, if $\sqrt{m} > \tilde{d} \log^2 n$.

4. Eigenvalues

Theorem 1 (Chung, Vu, and Lu, 2003)

Suppose $w_1 \geq w_2 \geq \dots \geq w_n$. Let μ_i be i -th largest eigenvalue of $G(w_1, w_2, \dots, w_n)$. Let $m = w_1$ and $\tilde{d} = \sum_{i=1}^n w_i^2 \rho$. Almost surely we have:

If (w_1, \dots, w_n) follows a power law distribution, $G(w_1, w_2, \dots, w_n)$ is called a **random power law graph**.

Apply Theorem 1 to the random power law graph:

The first k and last k eigenvalues of the random power law graph with $\beta > 2.5$ follows the power law distribution with exponent $2\beta - 1$. It results a “triangular-like” shape.

4.1. Proof of Theorem 1:

1. First we prove $\mu_1 \geq (1 + o(1))\sqrt{m}$.

We observe

- It contains a star of size $(1 + o(1))m$.
- The largest eigenvalue of a star of size m is $\sqrt{m - 1}$.
- $\mu_1(G) \geq \mu_1(H)$ for any subgraph H of G .

Hence $\mu_1 \geq (1 + o(1))\sqrt{m}$.

- $E(X) = \tilde{d}$.
- X concentrates on $E(X)$.

Lemma A:

Let X_1, \dots, X_n be independent random variables with

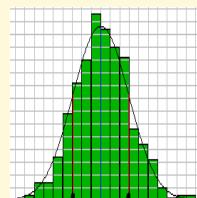

$$\Pr(X_i = 1) = p_i, \quad \Pr(X_i = 0) = 1 - p_i$$

For $X = \sum_{i=1}^n a_i X_i$, we have $E(X) = \sum_{i=1}^n a_i p_i$ and we define $\nu = \sum_{i=1}^n a_i^2 p_i$. Then we have

$$\Pr(X < E(X) - t) \leq e^{-\frac{t^2}{2\nu}};$$

$$\Pr(X > E(X) + t) \leq e^{-\frac{t^2}{2(\text{Var}(X) + at/3)}};$$

where a the maximum coefficient among a_i 's.

Lemma B:

$$\mu_1 \leq \tilde{d} + \sqrt{6\sqrt{m \log n}(\tilde{d} + \log n)} + 3\sqrt{m \log n}.$$

5.3. The proof of the semicircle law

Let $W(x)$ be the cumulative distribution function of the unit semicircle.

$$\int_{-1}^1 x^{2k} dW(x) = \frac{(2k)!}{2^{2k} k!(k+1)!}$$

$$\int_{-1}^1 x^{2k+1} dW(x) = 0$$

Let $C_{\text{nor}} = (\frac{2}{\sqrt{d}})^{-1} C$. Let $N(x)$ be the number of eigenvalues of C_{nor} less than x and $W_n(x) = n^{-1} N(x)$ be the cumulative distribution function. For every $k \ll \log n$,

$$\int_{-\infty}^{\infty} x^{2k} dW_n(x) = \frac{1}{n} E(\text{Trace}(C_{\text{nor}}^{2k})) = \frac{(1+o(1))(2k)!}{2^{2k} k!(k+1)!},$$

$$\int_{-\infty}^{\infty} x^{2k+1} dW_n(x) = \frac{1}{n} E(\text{Trace}(C_{\text{nor}}^{2k+1})) = o(1).$$

Thus, $W_n(x) \rightarrow W(x)$ (in probability) as $n \rightarrow \infty$.

6. Summary

For the random graph with given expected degree sequence $G(w_1, w_2, \dots, w_n)$, we proved that

- The largest eigenvalue μ_1 is essentially the maximum of \sqrt{m} and \tilde{d} , if they are apart by at least a factor of $\log^2 n$.

6.1. Related results and Links

(Chung and Lu)^a For $G(w_1, w_2, \dots, w_n)$, almost surely we have

1. All connected components are small if $\tilde{d} < 1$.
2. The unique giant component exists if $d > 1$.
3. The average distance is $(1 + o(1)) \frac{\log n}{\log \tilde{d}}$, if the expected degree sequence satisfies some mild conditions.

Applied the above results to random power law graphs, we have

Range	Average distance	Diameter
$2 < \beta < 3$	$\Theta(\log \log n)$	$\Theta(\log n)$
$\beta = 3$	$\Theta(\frac{\log n}{\log \log n})$	$\Theta(\log n)$
$\beta > 3$	$(1 + o(1)) \frac{\log n}{\log \tilde{d}}$	$\Theta(\log n)$
